Score: 0 / 5 (0%)

1. ____ are organelles responsible for cellular respiration, converting glucose into usable energy.

Your answer: sample answer — Correct answer: Mitochondria

The original text states: "Mitochondria are organelles responsible for cellular respiration, converting glucose into usable energy."

2. ____ is the process by which water moves through a plant and evaporates from leaves, stems, and flowers.

Your answer: sample answer — Correct answer: Transpiration

The original text states: "Transpiration is the process by which water moves through a plant and evaporates from leaves, stems, and flowers."

3. ____ and Plant Biology Photosynthesis is the process by which plants convert light energy into chemical energy stored in glucose.

Your answer: sample answer — Correct answer: Photosynthesis

The original text states: "Photosynthesis and Plant Biology Photosynthesis is the process by which plants convert light energy into chemical energy stored in glucose."

4. The Calvin cycle uses carbon dioxide and energy from ATP to produce glucose within the ____ stroma.

Your answer: sample answer — Correct answer: chloroplast

The original text states: "The Calvin cycle uses carbon dioxide and energy from ATP to produce glucose within the chloroplast stroma."

5. Stomata are small pores on the surface of leaves that regulate the ____ of gases like carbon dioxide and oxygen.

Your answer: sample answer — Correct answer: exchange

The original text states: "Stomata are small pores on the surface of leaves that regulate the exchange of gases like carbon dioxide and oxygen."
